PULSE — Full-Stack Incident Control Plane

End-Term MERN Capstone Project · Comprehensive Video Demonstration Script & Voiceover Guide

Target Video Duration: 5 – 7 Minutes	**Stack:** React 18, Node.js, Express, MongoDB, Socket.io, Docker
Primary Personas Shown: Sarah Chen (Admin) & Alex Rivera (Commander)	**Dual Execution:** Verified in Docker & Standalone Preview Sandbox

Script Outline & Scene-by-Scene Breakdown

Scene 1 [0:00 – 0:45 (45s)]: Introduction, Problem Statement & Architecture

Visual / On-Screen:	Show Slide/Title Card: Pulse Incident Control Plane. Cut to live login page with Obsidian/Champagne design.
Voiceover Narration:	*"Hello evaluators, welcome to Pulse — a mission-critical incident operations control plane engineered to replace chaotic, unstructured Slack threads with deterministic state-machine governance, live SLA tracking, and automated interactive SOP runbooks. During critical production outages, seconds matter. Pulse provides an authoritative source of truth for on-call engineers, incident commanders, and executives."*
Key Actions to Perform:	Hover over product insignia, display the 3 core pillars (24/7 SLA Sentinel, Real-time Event Bus, and OCC Guarded States).

Scene 2 [0:45 – 1:30 (45s)]: Authentication, RBAC Personas & Grading Convenience

Visual / On-Screen:	Login gate with email and password inputs, highlighting the 1-click Demo Credentials helper.
Voiceover Narration:	*"Security and RBAC are fundamental. Pulse enforces 4 distinct roles: Administrator, Incident Commander, Responder, and Viewer. Notice that there are zero hardcoded auto-logins; every user must explicitly authenticate. For evaluation convenience, we provide 1-click credential autofill pills. Let's select Administrator Sarah Chen and sign in to Mission Control."*
Key Actions to Perform:	Click 'Admin (admin@acme.dev)' autofill pill. Click 'Sign In to Console'. Observe smooth transition into the Mission Control Dashboard.

Scene 3 [1:30 – 2:30 (60s)]: Mission Control Dashboard & Real-Time Telemetry

Visual / On-Screen:	Dashboard showing MTTA/MTTR KPI cards, production service topology, live SLA countdowns, and incident queue.
Voiceover Narration:	*"Here in Mission Control, responders immediately see system posture. At the top, executive metrics track Mean Time to Acknowledge (14s), Mean Time to Restore, and SLA compliance. The topology map monitors API Gateway, Auth Cluster, Payment Engine, Postgres Primary, and Kubernetes Workers. Below is our prioritized incident queue, dynamically color-coded by severity (P1 to P4) with live pulsing SLA timers."*
Key Actions to Perform:	Hover over KPI cards with sparklines. Filter the feed by 'P1 Critical', then search for 'Gateway'. Demonstrate instantaneous filtering.

Scene 4 [2:30 – 3:30 (60s)]: Declaring an Outage & Automated SOP Runbook Matching

Visual / On-Screen:	Click 'Declare incident'. Modal opens with title, severity, and intelligent runbook preview.

Voiceover Narration:	*"Let's simulate a live outage. An engineer declares a P1 incident: 'API Gateway returning 503 — Elevated 5xx Rate'. Watch closely: as I type, Pulse's automated keyword matching heuristic immediately analyzes the title and pre-selects the 'API Gateway 5xx Spike Playbook' with 6 prescriptive SOP steps. Let's declare this incident."*
Key Actions to Perform:	Type title: 'API Gateway returning 503 — 5xx rate at 12%', select P1. Notice the playbook preview indicator. Click 'Declare Incident'. Toast notification confirms INC-00009 declaration.

Scene 5 [3:30 – 4:45 (75s)]: Incident War Room & Interactive Terminal SOP Execution

Visual / On-Screen:	Incident Detail Page: linear state pipeline, interactive runbook execution console, and chronological audit timeline.
Voiceover Narration:	*"We enter the incident War Room. At the top is our guarded finite state machine: FIRED, ACKNOWLEDGED, INVESTIGATING, MITIGATED, RESOLVED, and CLOSED. Responders cannot skip stages. On the right is the interactive SOP playbook. Rather than reading static wikis, engineers can run verified CLI commands. Let's click 'Run & Verify' on Step 1: Check Grafana Dashboard."*
Key Actions to Perform:	Click 'Run & Verify' on Step 1. Watch terminal output simulate live diagnostic probe with HTTP 200 OK. Step automatically marks COMPLETED with verification output recorded in the timeline.

Scene 6 [4:45 – 5:45 (60s)]: Optimistic Concurrency Control (OCC) & State Transitions

Visual / On-Screen:	Click 'Acknowledge' and advance to 'Investigating'. Open Transition Modal with mitigation details.
Voiceover Narration:	*"Now let's advance the incident lifecycle. Clicking 'Acknowledge' transitions the state from FIRED to ACKNOWLEDGED and halts the SLA timer. To protect against split-brain triage when multiple responders act simultaneously, Pulse implements Optimistic Concurrency Control (OCC) with document versioning. Notice how the timeline logs every actor, state change, and timestamp."*
Key Actions to Perform:	Click 'Acknowledge'. Then click 'Advance to Mitigated', enter root cause and mitigation summary: 'Traffic rerouted via fallback ingress gateway'. Transition successfully.

Scene 7 [5:45 – 6:30 (45s)]: Blameless Postmortems & Action Item Tracking

Visual / On-Screen:	Navigate to Postmortems tab. Show published postmortem for Incident #8.
Voiceover Narration:	*"When outages resolve, learning begins. Pulse features integrated blameless postmortems. Here is our published postmortem for Incident 8 with 5-Whys root cause analysis, impacted services, and assigned engineering action items with due dates. Commanders can export postmortems or track open remediation tasks."*
Key Actions to Perform:	Expand postmortem details. Toggle an action item checkbox to show real-time progress update.

Scene 8 [6:30 – 7:15 (45s)]: Analytics Overview, Reticle Verification & Closing

Visual / On-Screen:	Navigate to Analytics tab showing MTTA/MTTR distributions, severity breakdown charts, and responder workload.
Voiceover Narration:	*"Finally, the Analytics cockpit provides executive visibility into 14-day outage volume, MTTR trends, and responder workload balance. Pulse has been thoroughly tested both under full-stack Docker Compose and in standalone hosted preview mode with complete client-side sandbox fallback. Our login workflows have been verified with Reticle in-app verification. Thank you for evaluating Pulse!"*
Key Actions to Perform:	Show charts and responder distribution table. Show GitHub repo and Docker compose cleanliness.
